SUMMARY

Computer Science graduate with 2+ years building and securing production systems, and a consistent record of translating technical architecture into business outcomes for non-technical audiences. Designed and presented a Zero Trust transformation architecture — Prisma Access, NGFW, SD-WAN, and centralized policy management — for a multi-site enterprise migrating off a legacy multi-vendor firewall estate. Seeking a customer-facing systems engineering role in cybersecurity.

TECHNICAL SKILLS

Security & Networking: Zero Trust / ZTNA, SASE, next-generation firewalls, network segmentation, VPN & IPSec, MPLS and SD-WAN concepts, identity & access management (Okta, RBAC), Row-Level Security, IDOR / cross-tenant isolation testing, secure API design, TCP/IP & socket programming

Palo Alto Networks Platform: Prisma Access, Prisma SD-WAN, PAN-OS NGFW, Panorama / Strata Cloud Manager, ADEM, WildFire, Advanced Threat Prevention (solution-design exposure)

Languages: Python, TypeScript/JavaScript, Java, C++, C#, SQL, Bash

Backend & APIs: REST APIs, Next.js API routes, FastAPI, Node.js, Supabase (PostgreSQL, RLS, pgvector), ASP.NET Core MVC, async processing, multithreading & concurrency

Cloud & DevOps: AWS (EC2, S3, IAM), Docker, GitHub Actions CI/CD, Vercel, Linux

Data & Analytics: PostgreSQL, SQL Server, pandas/NumPy, Tableau, Power BI, SQL optimization

PROFESSIONAL EXPERIENCE

AI Engineer Intern | PM Accelerator (Attuned), Cohort 9

Jun 2026 – Aug 2026

- Built auth- and ownership-checked APIs on Supabase/PostgreSQL with Row-Level Security; wrote security and isolation test suites (auth, IDOR, cross-tenant) to validate access-control boundaries.
- Engineered a streaming LLM pipeline (NDJSON/SSE) with idempotent message persistence, atomic sequence allocation via Postgres advisory locks, and a strict performance contract on first-token latency.
- Implemented retrieval-augmented generation over pgvector with JSON-schema-constrained output and safe fallbacks; shipped full-stack in Next.js, React, and TypeScript on Vercel.

Junior Software Engineer | Tri Valley Urgent Care, Tracy, CA

Jul 2024 – Present

- Own OnDeck, a production scheduling and patient-management platform for a 7-day urgent care clinic; build secure services with authentication and role-based access control, deployed via Docker and GitHub Actions CI/CD.
- Work directly with clinic leadership to turn operational needs into technical requirements, then explain production issues, root-cause findings, and trade-offs back in plain language.

Data Analyst | Tri Valley Urgent Care, Tracy, CA

Jul 2023 – Jul 2024

- Delivered SQL dashboards and Python automation pipelines that replaced manual weekly reporting, cutting turnaround from hours to minutes and surfacing utilization trends leadership acts on.

Lead Computer Science Tutor | CSU East Bay STEM Lab, Hayward, CA

Jul 2023 – May 2025

- Mentored 150+ students in Python, Java, and C++, breaking down data structures, debugging, testing, and CI/CD for learners at every level.
- Redesigned the tutoring model from answer-giving to guided problem-solving and trained other assistants on it; increased session attendance and repeat engagement, and it became standard practice.

TECHNICAL PROJECTS

Enterprise Zero Trust Architecture Case Study (Palo Alto Networks SE Academy — Final Round): Designed and presented a security transformation for a 2,200-employee, 15-site enterprise running a legacy Fortinet/SonicWall estate over MPLS and IPSec. Mapped business pain points — SaaS backhaul latency, VPN bottlenecks, multi-vendor policy drift, ransomware exposure — to a consolidated architecture using Prisma Access (ZTNA with local SaaS breakout), Prisma SD-WAN, PAN-OS NGFW, Panorama/Strata Cloud Manager, and ADEM, with Okta as identity source. Delivered a phased adoption plan, competitive displacement rationale, and business-outcome analysis to a panel of Systems Engineers.

OnDeck — Clinic Scheduling Platform (Production): Scheduling and patient-management system running live in a clinical environment; JWT auth, role-based access, and document intake via vision models (Next.js 14, TypeScript, Supabase, Claude Vision).

Multiplayer Client-Server Application (Computer Networks): Concurrent Java client-server game using socket programming and multithreading, with synchronized state, error handling, and event-driven communication across clients.

Cloud-Based Inventory Management System (Capstone): REST API backend with layered architecture, optimized SQL, async processing, and a Redis cache-aside layer, deployed on AWS EC2 via Docker and CI/CD (Python, FastAPI, PostgreSQL).

EDUCATION & CERTIFICATION

B.S. Computer Science | California State University, East Bay, Hayward, CA

Graduated May 2025

Coursework: Security & Information Assurance, Computer Networks, Cloud Computing, Operating Systems, Distributed Systems

Certification: AWS Certified Cloud Practitioner (In Progress)
